# Capital Markets Monthly

## “September rain”?

While the beginning of August could hardly be described as a bed of roses, things turned out well in the end. The month kicked off with ominous signs of a "market meltdown" sparked by concerns over US growth, but also by speculators caught off guard by the twin forces of an appreciating yen and rising (base) rates. Just a few days later and losses had been recouped. As Japan's leading index, the **Nikkei 225** needed a bit more time until it was back into positive territory - it had fallen the furthest after all. But even it managed to drag itself out of the maelstrom. By September, it was practically sunshine and smiles again. Curiously, while the German economy shrunk in the second quarter and investment and consumer spending declined, the DAX - the benchmark for the German equity market - soared to new highs. This is testament to how the "open economy" (to paraphrase the philosopher Karl Popper) is good for companies and a taster of what "**deglobalisation**" may yet have in store as a large proportion of DAX-listed corporate

earnings are generated outside of the country.

At the time of writing, some of the other major indexes were also on the verge of topping, or had already topped, their all-time highs. These include the equally weighted S&P 500 for the US market.

Having entered the final third of the year, markets are already looking beyond the impending interest rate decision by the **Federal Reserve** (Fed) almost as far as the new year. Among other things, the outcome of the US **presidential election** on 5 November is likely to be pivotal in determining how 2025 unfolds.

The nomination of Kamala Harris by the Democrats has injected fresh momentum into the race and has also led to a shift in opinion polls. However, it remains far from certain who will ultimately be the 47th President of the United States ("**POTUS**") nor what majorities she or he will have to work with in both houses of Congress, as a third of the Senate and the entire House of Representatives are also up for re-election. That leaves plenty of room for uncertainty.

And uncertainty leads to the calendar effect, something that should not exist according to the doctrine of rational expectations and efficient capital markets. In fact, however, based on the average performance of indexes such as the MSCI World or the DAX over the last few decades, September has delivered negative returns. So, are we heading for a washout in September, in other words "September rain"?

## Publications

### → **Decarbonisation**

An brand new academic white paper comes to the conclusion, that the large majority (almost 90%) of #degrowth studies are opinions rather than analysis. Degrowth is not an option to stop climate change. We need green growth.

### → **Dimensions of disruption: Demographics**

Demographic growth implies that there will be further economic growth in the future. However, this will go hand in hand with higher wages and inflationary pressure as the number of people working shrinks relative to the total population. In this respect, there is a connection between demographic shifts and the other dimensions of disruption.

### → **7 habits of successful investors**

Seven simple habits can help to accumulate capital calmly and composedly. After all, your money should be working for you, not the other way around.

**Dr Hans-Jörg Naumer**

Global Capital  
Markets & Thematic  
Research

A word of caution when it comes to schematic thinking. While it is true that the median and average prices of the MSCI World and the DAX have been negative in recent decades (cf. chart), the deviation from these numbers is also very big. No reason, then, to dismiss fundamentals as they still support a "soft landing" scenario. Following somewhat sub-potential growth in the second quarter of 2024, momentum in the global economy slowed further in the second half of the year. Among the major industrialised countries, it was the **United States** that recorded the most pronounced deceleration. But the **euro area** and the **United Kingdom** economies also showed signs of backsliding, having staged a recovery in prior months. One economy that defied the downward trend was **Japan**, which is on track for stronger GDP (gross domestic product) growth in the last six months of the year. Sentiment in the overall economy remained gloomy, with weaker business sentiment worldwide partially offset by a slight improvement in consumer confidence. This, coupled with the current inflationary backdrop, suggests there is nothing to prevent the major central banks from launching (Fed) or continuing (e.g. ECB, the BoE (Bank of England) and the Swiss National Bank) their policy of monetary easing.

Overall, the picture described above would lend itself to the following **tactical allocation for equities and bonds**:

- Given looming interest rate cuts, cash is becoming increasingly unattractive to hold as an investment.
- An expected steepening of the yield curves away from short and medium maturities means longer maturities will become more appealing.
- In light of a slowdown in the economy, longer maturities should prove stable as inflationary pressure subsides.
- Higher-risk, and thus higher-yielding, forms of investment such as equities are coming to the fore.
- Based on our broad set of valuation criteria, equity markets are priced at varying levels of attractiveness depending on the region.
- While our in-house valuation "traffic light" for the euro area, the United Kingdom and emerging markets is "amber" or even "green", there is a more challenging pricing environment for US equities.
- However, it is important to consider the high valuation of the 'big 7' stocks separately. When these are excluded, the tech segment and the market as a whole do not appear overvalued.
- In addition, valuations should be seen in the context of earnings performance. As corporate earnings reports for the second quarter have shown, US companies still enjoy significant pricing power.
- What is noticeable is that, after the "meltdown" in August, investors' fascination with the "Magnificent 7" stocks appears to be waning. This is to be welcomed

and will help to broaden the base of the equity market.

- S&P 500 stocks, both equally and market capitalisation weighted, have indeed recovered strongly. However, the relative performance of both index measurements shows that the equally weighted S&P 500 performed better. For instance, the latter has even outperformed the NASDAQ and the FANG+ index, most recently at the turn of the month.
- If the equally weighted index performs better in relative terms, this indicates that the dominance of the previously leading index members has diminished. That is why it is important to monitor this development carefully.

And while we are on the subject of rain: there is also such a thing as warm "November rain". Historically, the last two months of the year have been favourable ones for equity markets. This year, the November effect may coincide with elections in the United States in as much as the post-election period is often the better one in terms of performance, as uncertainties that arise in the run-up to election day are then priced out again.

Wishing you a warm shower of returns on your investments.

Yours,  
Dr Hans-Jörg Naumer

## Investment topic:

**Dividends – Stability in an era of disruption**

- **Deglobalisation, digitisation, demographics** or **decarbonisation** – disruption is all around us. And it is here that dividends have a role to play. Their stabilising effect on the overall performance of an equity portfolio should not be underestimated.
- As our calculations show, dividends have made significant contributions to total equity returns in the past. During the past 40 years, their share of total returns of European equities amounted to more than one third.
- In addition, companies tend to stick to their dividend policy and to increase rather than cut dividends, even if their earnings grow more slowly.
- In fact, stocks of dividend-paying companies have usually been less volatile than stocks of companies which do not pay dividends.
- This also brings investment income into focus: why not invest in the expectation of receiving an “extra income” in addition to your current income from your work or pension?
