# The Week Ahead

## ECB easing: steady as she goes?

Traditionally, market activity begins to slow after the Thanksgiving holiday as year-end considerations cause banks to curtail balance sheet usage while thinner liquidity makes investors mindful of the increased cost of changing positions. This year, a number of important risk events seem likely to ensure that there is plenty for investors to chew over even if historical patterns repeat.

In the **euro area**, the latest news for economic activity has disappointed. The flash Purchasing Managers Index (PMI) for November suggested that growth momentum into the year-end may be fading, with the composite index level falling from 50 to 48.1, the first time the index has been materially below 50 since the start of the year. Business caution has likely been amplified by lackluster consumer spending, the shift towards fiscal tightening from many euro area governments and the expectation of a

Sean Shepley Senior Economist round of tariff increases under incoming President Trump.

This raises a dilemma for the ECB (the European central bank). On the one hand, although euro area headline inflation has fallen back to the ECB's 2% target, the central bank has been reluctant to look too far ahead because the decline in core inflation has stalled since the spring (core inflation - which excludes food and energy – has been around 2.75% yoy since then). On the other hand, the ECB has acknowledged in recent quarters that growth has been weaker than it anticipated, responding to the release of disappointing PMI data at the beginning of September by cutting interest rates by 25bp even though inflation news that month had shown little signs of improving. It seems likely that the ECB will again lower its growth projection at the December meeting, hence it makes sense to review their options.

The first is the most cautious: the ECB could lower interest rates by 25bp in December and then continue to cut at a pace of 25bp each quarter. The result would be short-dated interest rates around 2.15% in the third quarter of 2025.

The second option sees the central bank cut at a pace of 25bp per meeting. With seven meetings between now and next September, the result would be interest rates around 1.40% if the ECB was to cut at each one.

The third option would be to accelerate the pace of cuts in the

### **Publications**

#### → Multi asset: The comeback

The aim behind "multi asset" is to improve the risk/return profile of an investment by allocating capital across a multitude of assets. This approach to investment struggled during the phase of low and negative returns. Meanwhile, it may be poised for a comeback.

#### → Navigating market concentration as sustainable investors

One of the defining features of equity markets over recent years has been extremely high levels of index concentration, with the so-called "Magnificent Seven" making up around a third of the total market capitalization of the S&P 500.

### → Populism: would markets vote for it?

Populists may excite many voters, but markets often aren't fans of the higher spending, inflation, and lower growth their policies tend to bring.

near term before slowing later which is what market participants collectively see as most likely. The market anticipates that interest rates will be 1.70% next September.

Why do the different options matter? The chart on the following page shows the trajectories for interest rates compared with a plausible zone for neutral interest rates (i.e. the

#### **THE WEEK AHEAD, 29.11.2024**

level of interest rates at which monetary policy is neither restrictive or stimulatory for the economy) which we judge to be between 2.0 - 2.5%.

Cutting interest rates by 25bp per quarter would mean monetary policy remains restrictive until next summer. That appears unnecessarily long considering how weak growth remains. Cutting rates by 25bp every meeting would mean interest rates reach 2.5% in March and 2.0% in June. By contrast, the market judges that a 50bp ECB rate cut might be seen in December and/or February, leaving interest rates at 2.15% in March and around 1.80% in June. This latter strategy has the merit of ensuring monetary policy becomes neutral as quickly as possible, then allowing the ECB to judge how much further to cut interest rates later in the year.

We do not expect the ECB to pre-commit to any of these strategies in December. However, we think the case for increasing the pace and perhaps the magnitude of rate cuts is increasingly strong, something investors should consider when evaluating the potentially lower return from holding cash next year.

ECB rate cuts: is there a case to accelerate?

#### The week ahead

The first week of the last month of the year sees the release of **PMIs** for all the major countries. Of them all, **China's** may be the most interesting. After a range of easing measures announced since September, there have been signs of improvement in domestic demand in China. Separately, widespread expectations of tariff increases during President Trump's second term in office may have influenced demand since the election. Which of these factors turns out to be most influential will impact the market's assessment of growth momentum into early 2025.

In the **US**, next week sees the release of **labour market data**. October was heavily influenced by storms and strikes, the effects of both of which should unwind in next week's data. The result should be a healthy bounce-back in private sector payrolls though recent data have suggested that those becoming unemployed are taking longer to find a new job, suggesting that the unemployment rate may also rise.

In the **euro area**, the final estimate of **Q3 GDP** should confirm a better quarter. However, some of the improvement now looks to have been temporary, given the recent decline in the PMI. Also in the euro area next week, retail sales will provide an indication of consumer demand at the start of Q4 while the unemployment rate is likely to remain close to historic lows despite the weakness of the economy.

Please join us in watching closely as the ECB's last interest rate decision for 2024 draws near.

Sean Shepley
